

## ADULT GUIDE: ASSESSMENT and MANAGEMENT of PAIN

Assessment and Diagnosis	Treatment	Management and Monitoring
<p>While all patients should be screened for pain, identifying a specific etiology for pain is challenging. A complete assessment, including physical, mental, emotional, and spiritual components is helpful in determining the appropriate course of management.</p> <p>All patients should be actively engaged in self-management of their pain (an ‘active’ approach.) If necessary, therapies that represent a ‘passive’ approach may be utilized to encourage self-management strategies to help achieve patient centered goals.</p> <p><b>History: Assess</b></p> <ul style="list-style-type: none"> <li>Onset, location, quality, intensity, temporal pattern, aggravating and alleviating factors, associated symptoms</li> <li>Characteristics of pain</li> <li><b>Red flags:</b> indicative of underlying pathology</li> <li><b>Yellow flags:</b> Psychosocial factors shown to be indicative of long-term chronicity and disability: A negative attitude that pain is harmful or potentially severely disabling; fear avoidance behavior and reduced activity levels; an expectation that passive, rather than active, treatment will be beneficial; a tendency to depression, low morale, and social withdrawal; social or financial problems</li> <li>Review previous methods of treatment, response to treatment &amp; adverse reactions</li> <li>Other medical and surgical conditions</li> <li>Substance use</li> </ul> <p><b>Psychosocial History: Assess</b></p> <ul style="list-style-type: none"> <li>Depression, anxiety, PTSD, sleep pattern, suicide risk</li> <li>Impact on quality of life, ADLs &amp; functional status</li> <li>Pain coping skills</li> <li>Patient, family, and caregiver’s cultural and spiritual beliefs</li> <li>Secondary gain: psychosocial/financial</li> </ul> <p><b>Pain, Function &amp; Quality of Life: Assess</b></p> <ul style="list-style-type: none"> <li>Evaluate pain on all patients using the 0-10 scale (Use Faces Pain Scale – Revised): <ul style="list-style-type: none"> <li>A. mild pain: 1-3</li> <li>B. moderate: 4-7 (interferes with work or sleep)</li> <li>C. severe: 8-10 (interferes with all activities)</li> </ul> </li> <li>Capture variation in pain severity at different sites of pain (Use Ransford Pain Drawing)</li> <li>Recognize pain varies at different times of day</li> <li>Assess impact of pain on function &amp; quality of life (Use PEG Scale: A Three-Item Scale Assessing Pain Intensity and Interference)</li> <li>Ask the patient what matters most and about personal goals for care</li> </ul> <p><b>Diagnosis &amp; Treatment Plan</b></p> <ul style="list-style-type: none"> <li><b>Order and evaluate appropriate diagnostic testing</b></li> <li>Determine diagnosis</li> <li>Develop &amp; document a written treatment plan in medical records.</li> </ul>	<p><b>Goals</b></p> <ul style="list-style-type: none"> <li><b>Treat acute pain actively to avoid transition to chronicity.</b></li> <li><b>Treat chronic pain thoughtfully and systematically.</b></li> <li>If possible, identify and address the etiology of pain, including potential confounders (such as psychosocial issues.)</li> <li>Maintain an active approach that enables the ability to function safely and productively.</li> <li>Allow emergence of emotions associated with pain.</li> <li>Establish patient specific <b>SMART (Specific, Measurable, Agreed Upon, Realistic, Time-based)</b> goals that result in <b>improved function and quality of life &amp; reduction in suffering.</b></li> </ul> <p><b>Nonpharmacologic Therapy: Active Approach</b></p> <ul style="list-style-type: none"> <li>Patient and Family Education</li> <li>Cognitive Behavioral Therapy; Supportive Psychotherapy</li> <li>Community and Web-based Support Group</li> <li>Exercise: Yoga, Tai Chi, Qi Gong, Walking, Water Therapy</li> <li>Meditation, Mindful Practice; Visualization/Interactive Guided Imagery</li> <li>Physical Therapy; Chiropractic/Osteopathic Care</li> <li>Prayer, Spiritual &amp; Pastoral Support</li> <li>Relaxation Techniques: Biofeedback</li> </ul> <p><b>Nonpharmacologic Therapy: Passive Approach</b></p> <ul style="list-style-type: none"> <li>Acupressure (trigger point therapy)</li> <li>Acupuncture (trigger point therapy)</li> <li>Counterstimulation: TENS</li> <li>Cutaneous Stimulation: Ice, Heat</li> <li>Manipulation/Manual Therapies</li> <li>Massage, Music, Hydrobath</li> <li>Therapeutic Touch, Reiki, Healing Touch</li> </ul> <p><b>Pharmacologic Therapy</b></p> <ul style="list-style-type: none"> <li>Nonpharmacologic therapy and nonopioid pharmacologic therapy are preferred for treatment of pain.</li> <li>For neuropathic pain, use anti-epilepsy drugs (AEDs) first</li> <li>Use adjuvant therapies or analgesics as needed</li> <li><b>Opioids are not first line for chronic pain</b>, which should be managed with an active approach and non-opioid pain relievers, if possible.</li> <li>Consider opioid therapy based on a careful risk assessment that determines the expected benefits for both pain &amp; function are anticipated to outweigh risks. If opioids are used, establish treatment goals, combine w/active approach &amp; nonopioid analgesics as indicated.</li> <li>When opioids are indicated establish treatment goals, combine with an active approach &amp; adjuvant medication as indicated. See Opioid Guidelines on Equianalgesic Table for Adults.</li> <li>Avoid combination with potentiator drugs (i.e. benzodiazepines)</li> </ul>	<p><b>General</b></p> <ul style="list-style-type: none"> <li><b>Reassess pain, quality of life and function regularly, focusing on patient-centered goals</b></li> <li>Follow amount and duration of response</li> <li>Partner with patient/family in setting goals of care</li> <li>Balance function vs. acceptable control of pain</li> </ul> <p><b>Referrals</b></p> <p><b>Acute pain</b></p> <ul style="list-style-type: none"> <li>Refer early to appropriate specialist or Pain Center, if diagnosis unclear or pain refractory to treatment</li> </ul> <p><b>Chronic pain</b></p> <ul style="list-style-type: none"> <li>Set realistic chronic care goals</li> <li>Transition from passive recipient to patient-directed management.</li> <li>Refer “difficult to treat” cases (H/O substance abuse, neuropathic pain, rapidly escalating opioid doses) to physician with pain management expertise</li> </ul> <p><b>Special Considerations for Patients on Opioids</b></p> <ul style="list-style-type: none"> <li>Use risk assessment tools (e.g. ORT-R), treatment agreements, and medically necessary urine drug testing for compliance/diversion</li> <li>Check Prescription Drug Monitoring Program for opioids or benzodiazepines from other sources</li> <li>Follow state and federal regulations</li> <li>Evaluate benefits &amp; harms w/patients in 1-4 wks. of starting opioid for chronic pain or dose escalation.</li> <li>Consider co-prescribing naloxone in at-risk patients (i.e. H/O substance abuse, high MME dose, polypharmacy)</li> <li>Review safe disposal of opioids</li> <li>Evaluate benefits &amp; harms of continued therapy with patients every 3 months or more frequently.</li> <li>If benefits do not outweigh harms of continued opioid therapy, optimize other therapies and work with patients to taper opioids to lower dosages or to taper and discontinue opioids.</li> <li><b>Avoid abrupt cessation of opioids</b></li> <li>Address opioid-seeking behavior and addiction behaviors without moving patients to illegal means of obtaining opioids. Refer to addiction or pain specialist and community services as needed</li> </ul> <p><b>Special Situations</b></p> <p><b>Anxiety and depression:</b> See Depression Guidelines</p> <p><b>Verbally non-communicative patients:</b> See Nurse’s Guide</p>
